Excerpt: .alternating with yellowish arenaceous shales that contain a Lamellibranch fauna composed mostly of small species. There is also a thin stratum containing an abundance of Gastropods. On the surface in the upper part of the western side of the hill are great numbers of excellent specimens of Gryphaea Pitcheri Mort. as figured by Marcou on pi. IV, figs. 5 a, b, and 6--G. forniculata White, of his Geology of North America. Around the escarpment of the hill are numerous large blocks of the shaly pinkish limestone of the upper Kiowa shales, which at this locality is thicker and more massive than is generally the case. Many of these rocks were drawn to Avilla and used for foundations when the town was built and large blocks may now be seen about the hamlet. It is thought the quartzitic character of the sandstone just described, and especially...
