In connexion with this it should be observed that the determinant in 2 is bound to vanish, from the mere fact that on putting  $x = 0$ , it becomes an invariant of  $(o a a, -.aM)(, \vee Yei$  and that its several terms are what the  $a$  elements become when  $X$  becomes when  $4-Jctj$ . We are thus led to view the whole subject of invariance under a somewhat broader aspect, as a theory not directly concerned with quantics, but with homogeneous functions in general. VOL. IX.  $G f$  being a perfectly general operand, or as we may phrase it, an operand absolute. This enables me to express the idea which was struggling into light when I wrote the antecedent footnote. It is this: Let  $0$  now be made to do duty for any given homogeneous function of given order  $X$  in  $x, y$ . The value of  $F$  will remain unaltered when we write  $X--/t + 1,---$ in place of  $Y, y (x-/ + a)(x-/ + i)? x$  This is an immediate consequence of the invariative property of  $F$  combined with the fact that previously shown. The numerators in the above expressions are the first terms in the expression for  $y Y$  as a function of  $xX$  modified by writing successively  $X--/ + 1, X--(i + 2, .X$  in place of  $X$  on account of the powers of  $X$  which precede  $Yf Yf. FM$  in  $F$  and lower the degrees of the operands in respect...
