Original publisher: Canoga Park, Calif. : Rockwell International, Rocketdyne Division, 1991 OCLC Number: (OCoLC)63816531 Excerpt: . . . RI RD 91-114 2. 1. 1 Method of Solution. The analytical and solution method employed is based on the well known modal analysis technique, and therefore the natural frequencies and mode shapes of the component to be analyzed are required as input to the program. Thus, the relationship between the finite element model needed to extract the modal characteristics and the integration program is noted. Then, the solution technique is presented. Based on strain energy and kinetic energy considerations, the finite element formulation develops the undamped, homogeneous equations of motion in terms of physical coordinates: $M \ddot{x} + Kx = 0$ (2) where: M mass matrix x displacement vector in terms of--physical coordinates, and K stiffness matrix. Assuming a harmonic solution for $x(t)$, $x(t) = v e^{i\omega t}$ (3) where v eigenvector (mode shape), i -i -5, and w circular frequency (square root of the eigenvalue). 2. 1-3 This item ships from La Vergne,TN.
