We will now give some specimens of the investigations and conclusions of Spitzer. In Arts. 250 and 251 we have shewn how in general we may distinguish between the maximum and minimum of $\int V dx$, where $\int V$ involves x , y , and y' . Now suppose for a particular case that $r^2 F_{ps} = 0$, then, excluding the integrated terms, the value of \int , on page 271 will take the form $\int V dx$. Thus for a maximum or minimum it is necessary that dV/dx should be respectively constantly negative or constantly positive throughout the limits of the integration. Since $r^2 = 0$, it is obvious that F must be of the form, thus the differential equation from which y is to be found, namely $dV/dx = 0$. This gives y as a function of x without any arbitrary constant. Thus, adopting geometrical language, the limiting points between which the required curve is to be drawn cannot be taken arbitrarily; they must lie on the curve determined by $r^2 = 0$, or else the problem will be impossible. In the next place let us suppose that besides $r^2 = 0$, we have also $r^2 - y'' = 0$; Spitzer in his fourteenth section deterdf ax ay ay mines what the form of F must then be, in the following manner. $dV...$
